1 Web Overview

1.1 Brief

The device provides the Web-based network management function to facilitate the operations and maintenance on devices. Through this function, the administrator can visually manage and maintain network devices through the Web-based configuration interfaces. [Figure 1-1](#) shows a Web-based network management operating environment:

Figure 1-1 Web-based network management operating environment

1.2 Logging in to the Web interface

The device is provided with the default Web login information. You can use the following default information to log in to the Web interface:

- Username: 'admin'
- Password: 'admin'
- IP address of the device: 192.168.1.1

To log in to the device through the Web interface:

1. Connect the Ethernet interface of the device to the PC using a crossover Ethernet cable.
2. Configure an IP address for the PC and ensure that the PC and device can communicate with each other properly.
3. Modify the IP address of the PC to one that within the network segment 192.168.1.0/24 (except for 192.168.1.1), for example, 192.168.1.100.
4. Open the browser, and input the login information.
5. On the PC, open the browser, type the IP address `http://192.168.1.1` in the address bar, press Enter and you can enter the login page of the Web interface, as shown in [Figure 1-2](#). Input the username admin and password admin, and click Login.

Figure 1-2 Login page of the Web interface

Authorization Required

Please use Firefox, Chrome, Microsoft Edge browser to access the page.

1.3 Basic Information

After logging in to the Web interface, you will enter the Basic Information page, as shown in [Figure 1-3](#). [Table 1-1](#) lists the configuration items of the basic information. Host Name can be modified, after you set a new string to it, click Apply button to change it.

Figure 1-3 Basic Information page

Basic Information

Host Name	<input type="text" value="SWITCH"/>
MAC Address	00-00-00-00-00-B4
Hardware Version	1.00

✎ RESET

Table 1-1 Basic Information configuration items

Item	Description
Host Name	Displays the device name. Allows user to change it.
MAC Address	Displays the device' s MAC address.

Hardware Version	Displays the device' s hardware version.
Software Version	Displays the device' s software version.
Release Date	Displays the device software' s release date.
Product SN	Displays the device' s serial number.
CPU Used	Displays the device' s cpu status.
Memory Avail	Displays the device' s memory status.
System Uptime	Displays the time from last system start.

1.4 Logging out of the Web interface

Click Logout button in the navigation area to quit Web-based network management. The system does not save the current configuration before you log out of the Web interface. Therefore, we recommend that you save the current configuration before logout.

NOTE:

- You cannot log out by directly closing the browser.
-

1.5 Save Configuration

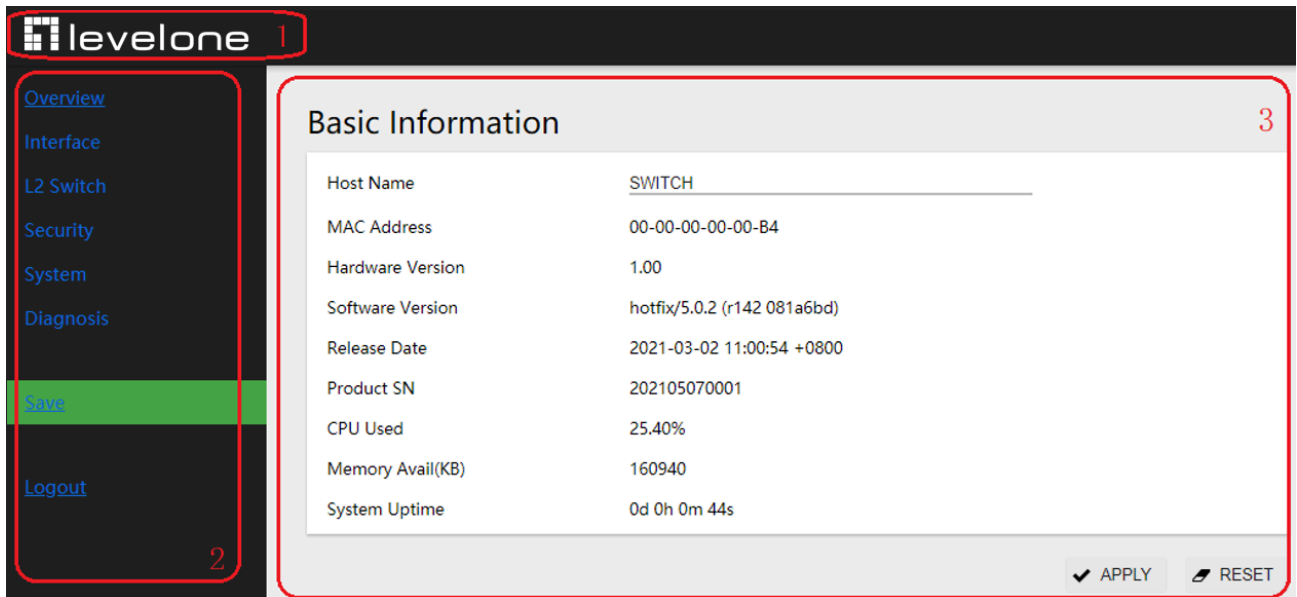

The save configuration module provides the function to save the current configuration to the configuration file for the next startup.

Click the Save button to save the current configuration to the configuration file.

1.6 Introduction to the Web interface

The Web interface is composed of three parts: navigation area, title area, and body area, as shown in [Figure 1-4](#).

Figure 1-4 Web-based configuration interface

(1) Item	(2) Navigation area	(3) Body area
----------	---------------------	---------------

- Item: Product Name
- Navigation area: Organizes the Web-based NM function menus in the form of a navigation area where you can select function menus as needed. The result is displayed in the body area. The Web network management functions not supported by the device are not displayed in the navigation area.
- Body area: The area where you can configure and display a function.

1.7 Introduction to the Web-based functions

Table 1-2 describes the Web-based network management functions in detail.

Table 1-2 Description of Web-based functions

Function menu		Description
Overview	Basic information	Displays device information.
Interface	Port management	Displays interface information and statistics. Allows to create, modify, delete, and enable/disable an interface.
	Port Ratelimit	Display and allows set the port ratelimit.
	Strom Control	Display and allows set strom control mode.
	Port Statistics	Display and allows clear port statistcs

	Port mirror		Display and allows create/remove a port mirroring group.	
	Port isolate		Allows user to create isolate port groups.	
	Link Aggregation	Global Configuration	Display and allows set Load balancing method.	
		Aggregation Port	Display the information of the Aggregation Port.	
		Aggregation Member	Allows set Aggregation Member ID and Aggregation mode.	
	PoE management	PoE Global Configuration	Display and allows set PoE supply power and enable/disable legacy mode.	
PoE interface Configuration		Display the statistics of the PD devices. Allows Enable/Disable PoE for the PoE interface		
network	VLAN	VLAN	Allows user to create, modify and delete VLANs.	
		Interface	Allows user to create, modify, delete, and enable/disable an interface. Allows user to modify the VLANs to which a port belongs.	
	QinQ	Configuration	Display and allows create/remove port QinQ	
		Apply	Enable the QinQ function of the port	
	ERPS	Summary	Displays the detailed information of the ERPS	
		Configuration	ERPS Ring Configuration	Allows user to configure the ERPS Ring ID, east interface and west interface.

		ERPS Instance Configuration	Allows user to configure the ERPS RAPS VLAN, Data VLAN, Owner interface.
IGMP Snooping	Summary	Displays the detailed information of the IGMP Snooping	
	Configuration	IGMP Snooping	Allows user to enable/disable IGMP Snooping.
		IGMP Mrouter Interface	Allows user to configure IGMP Mrouter Interface.
		IGMP Static Group	Allows user to configure IGMP Static Group
Spanning Tree	Summary	Display the detailed information of the MSTP	
	Global Configuration	Display and allows set MSTP globe configuration	
	MST Configuration	Display and allows set the information of MST configuration	
	Instance	Allows create and remove MSTP Instance	
	Interface	Display and allows set MSTP interface configuration	
MAC management	MAC management	Allows set MAC Ageing Time.	
	Static MAC Address	Allows set Static MAC Address.	
	Filter MAC Address	Allows set Filter MAC Address.	
Global Configuration		Enable LLDP fuction, confiure system name and	

			system description	
	Port		Configure interface' s parameters	
	Statistics		Show LLDP status of device	
Security	ACL	ACL	Allows create/remove/modify an ACL Rule.	
		Apply	Allows configure the port rule.	
	QoS	Summary	Display and allows configure QoS global configuration and Queue Weight.	
		Interface trust mode	Display and allows Configure interface trust mode.	
		CoS Map	Display and allows Configure CoS Map.	
		DSCP Map	Display and allows Configure DSCP Map.	
		Policy	Display and allows Configure QoS Policy.	
	DHCP Snooping	Enable/Disable	Enable/Disable DHCP Function.	
		DHCP Snooping Trust	Allows user to configure the status of the DHCP Snooping function and modify the trusted and untrusted attributes of a port.	
	802.1 X Authentication	Summary	Display 802.1x authentication profile	
		Configuration	Global Configuration	Enable/disable
			Port Configuration	Set 1x rules of the interface
	MAC Authentication	Summary	Displays MAC authentication profile	
		Configuration	Global Configuration	Enable/disable
			Port Configuration	Set MAC rules of the interface
	RADIUS	Global Configuration	RADIUS global configuration	

		Server	Show/configure RADIUS server configuration	
	Port Security	Port Configuration	Allows user to configure port security function	
		MAC Configuration	Allows user to configure MAC security function	
	IP Source Guard	Summary	Display IP source guard summary	
		Port Configuration	Allows user to configure port security function	
		User Configuration	Allows user to configure VID, MAC address, IP address of the interface	
	System	Management IP Addresss		Allows user to Configures the management VLAN, IP address and mask.
		User management		Allows user to change the password.
		Service	Telnet Server	Allows user to Enable/Disable Telnet Server.
SSH Server			Allows user to Enable/Disable SSH Server.	
HTTP Server			Allows user to Enable/Disable HTTP Server.	
HTTPS Server			Allows user to Enable/Disable HTTPS Server.	
SNMP		SNMPv1 / v2c	Display and allows configure snmpv1/v2c.	
		SNMPv3	Display and allows configure snmpv3	
Date/Time		Displays and allows configuration of the system date and time.		
Configuration File	Backup	Allows user to back up the configuration file for the next startup to the host of the current user.		

	Management	Restore	Allows user to upgrade the configuration file on the host of the current user to the device for the next startup.
		Reset to Factory Defaults	Allows user to restore the system to factory defaults.
	System Upgrade		Allows user to upload the file to be upgraded from the local host to upgrade the system software.
	Log		Allows user to generate a diagnostic information file, view the file or save the file to the local host.
	Reboot		Allows user to reboot the device.
Diagnosis	Network Utilities		Perform the ping/trace route operation and display the results.
	Optical Transceiver Information		Display optical module information, such as manufacturer, serial number, optical power, etc
Save	\		Allows user to save the current configuration to the configuration file for the next startup.
Logout	\		log out of the Web interface

2 Interface

2.1 Port management

You can use the interface management feature to view interface information, create/remove logical interfaces, change interface status, and reset interface parameters, as shown in [Figure 2-1](#).

Figure 2-1 Port management page

Table 2-1 Configuration items of configuring an interface

Item	Description
Name	The name of the logical interface.
Description	Set the description of a logical interface.
Medium type	Set the medium type of the Combo ports <ul style="list-style-type: none"> • RJ45: the mode of port is 10/100/1000BASE-T • SFP: the mode of port is 1000BASE-X Note: only for combo ports.
Speed	Set the port' s transmission rate: <ul style="list-style-type: none"> • 10: indicates 10 Mbps • 100M: indicates 100 Mbps • 1000M: indicates 1000 Mbps • Auto: indicates auto-negotiation Note: only for copper ports.
Duplex	Set the port' s duplex mode: <ul style="list-style-type: none"> • AUTO: indicates auto-negotiation • FULL: indicates full duplex • HALF: indicates half duplex Note: only for copper ports.
Port Mode	Set the port' s mode <ul style="list-style-type: none"> • 100BASE-FX: indicates the port mode is 100BASE-FX.

	<ul style="list-style-type: none"> • 1000BASE-X: indicates the port mode is 1000BASE-X. • SGMII: indicates the port mode is SGMII. • 2500BASE-X: indicates the port mode is 2.5G BASE-X. • 10G BASE-X: indicates the port mode is 10G BASE-X. <p>Note: only for fiber ports.</p>
Autoneg	<p>Enables or disables port's autoneg.</p> <p>The auto-negotiation function needs to be enabled or disabled at the same time as the peer end, otherwise a link failure will occur.</p> <p>Note: only for fiber ports.</p>
Flow Control	Enables or disables flow control on the port.
MTU	Allows or forbids jumbo frames to pass through the port.
Admin Shutdown	Shutdown/no shutdown the port.

2.2 Port Ratelimit

Port-based rate limiting allows you to limit the speed at which network traffic is sent or received by a device that is connected to a port on your switch. Unlike 802.1p Quality of Service (QoS), port-based rate limiting does not prioritize information based on type. Rate limiting simply means that the switch will slow down traffic on a port to keep it from exceeding the limit that you set. If you set the rate limit on a port too low, you might see degraded video stream quality, sluggish response times during online activity, and other problems.

The best use of rate limiting is to keep low-priority devices that are connected to your switch from using too much of your bandwidth and slowing down your other connected devices. A combination of rate limiting and QoS can help you maximize your network's efficiency and prioritize devices and activities.

Configuring Port Ratelimit

1. Select Interface > Port Ratelimit in the navigation area to enter the port ratelimit page as shown in [Figure 2-3](#).

2. Select the ports to be configured, as shown in [Figure 2-4](#), type the number in the box. [Table 2-2](#) describes the configuration items of configuring an interface.
3. Click the Apply button.
4. Click the Save button in the navigation area.

Figure 2-3 Port Ratelimit status page

Port Ratelimit					
<input type="checkbox"/>	Name	In CIR(kbps)	In CBS(kB)	Out CIR(kbps)	Out CBS(kB)
<input type="checkbox"/>	gigabitEthernet0/1	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/2	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/3	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/4	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/5	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/6	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/7	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/8	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/9	0	0	0	0
<input type="checkbox"/>	gigabitEthernet0/10	0	0	0	0

Figure 2-4 Port Ratelimit configuration page

Port Ratelimit	
Name	gigabitEthernet0/10
In CIR(kbps)	<input type="text" value="0"/> <small>ⓘ <64-1000000></small>
In CBS(kB)	<input type="text" value="0"/> <small>ⓘ <32-16384></small>
Out CIR(kbps)	<input type="text" value="0"/> <small>ⓘ <64-1000000></small>
Out CBS(kB)	<input type="text" value="0"/> <small>ⓘ <32-16384></small>

**NOTE:**

- CBS embodies a rate-limit feature for policing traffic. When policing traffic with CBS, here recommends the burst value 4 times of the limit value. If the burst values are too low, then the achieved rate is often much lower than the configured rate.

Table 2-2 Port Ratelimit Configuration items

Item	Description
In CIR (kbps)	Specify the rate limit in the inbound direction (KBits).
In CBS (KB)	Specify the burst size in the inbound direction (KBits).
Out CIR (kbps)	Specify the rate limit in the outbound direction (KBits).
Out CBS (KB)	Specify the burst size in the outbound direction (KBits).
Apply	Click to enable port ratelimit.
Clear	Click to clear the box.

2.3 Strom Control

A traffic storm occurs when a large amount of broadcast, multicast, or unicast packets congest a network.

You can use the storm suppression function to limit the size of a particular type of traffic (currently broadcast, multicast and unknown unicast traffic) on a per-interface basis in Ethernet port view or port group view.

In interface or port group view, you set the maximum broadcast, multicast or unknown unicast traffic allowed to pass through an interface or each interface in a port group. When the broadcast, multicast, or unknown unicast traffic on the interface exceeds the threshold, the system discards packets until the traffic drops below the threshold.

Configuring the Storm Control on an Ethernet Port

1. Select Interface > Strom Control in the navigation area to enter the storm control page as shown in [Figure 2-5](#).
2. Select the ports to be configured, click Edit to enter the page shown in [Figure 2-6](#).

3. Configure the type of the storm control and type the percentage in the box below. The description of the storm control is described in [Table 2-3](#).

4. Click the Apply.

5. Click the Save in the navigation area.

Figure 2-5 Storm Control page

Item	Description
------	-------------

Name	The name of the logical interface.
Rx Packets	The packets number of the interface received.
Rx Bytes	The Bytes number of the interface received.
Tx Packets	The packets number of the interface transmitted.
Tx Bytes	The Bytes number of the interface transmitted.
Rx pps(pps)	The speed of the interface received, pps (bit per second).
Rx bps(bps)	The speed of the interface received, bps (bit per second).
Tx pps(pps)	The speed of the interface transmitted, pps (bit per second).
Tx bps(bps)	The speed of the interface transmitted, bps (bit per second).
Clear	Click to clear the statistics.

2.5 Port Mirror

Port mirroring is to copy the packets passing through one or multiple ports (called source interface) to a port (called the destination interface) on the local device. The source interface is connected with a monitoring device. By analyzing on the monitoring device, the packets mirrored to the destination interface, you can monitor the network and troubleshoot possible network problems.

Figure2-8 A port mirroring implementation

Creating a mirroring group

1. Select Interface > Port Mirror in the navigation area to enter the Port mirror page as shown in

Figure 2-9.

Figure 2-9 Port Mirror Page

Session	Destination Interface	Source Interfaces	Edit	Delete
This section contains no values yet				

+ ADD

- Click the +Add to enter the page for creating a mirroring port, as shown in Figure 2-10. Table 2-5 describes the configuration items of creating a mirroring group.

<input type="checkbox"/> qiqabitEthernet0/10		

BACK APPLY RESET

- Configure the 'Session' , 'Destination Interface' , 'Source Interfaces' .
- Click Apply.
- Click Save in the navigation area.

Table 2-5 Configuration items of creating a mirroring group

Item	Description
Session	ID of the mirroring group to be created
Destination Interface	the monitor port for the mirroring group
Source Interface	mirroring ports for the mirroring group

2.6 Port Isolate

Usually, Layer 2 traffic isolation is achieved by assigning ports to different VLANs. To save VLAN resources, port isolation is introduced to isolate ports within a VLAN, allowing for great flexibility and security.

1. Switch support multiple isolation groups which can be configured manually. These devices are referred to as multiple-isolation-group devices.
2. There is no restriction on the number of ports assigned to an isolation group.
3. Within the same VLAN, Layer 2 data transmission between ports within and outside the isolation group is supported.

Configuring an Isolation Group

1. Select Interface > Port Isolate in the navigation area to enter the Port isolate page as shown in Figure 2-11.
2. Select the port to be isolated, click Enable/Disable button.
5. Click Save in the navigation area.

Figure 2-11 Port Isolate page

Port Isolate	
Name	Enable/Disable
gigabitEthernet0/1	DISABLED
gigabitEthernet0/2	DISABLED
gigabitEthernet0/3	DISABLED
gigabitEthernet0/4	DISABLED

2.7 Link Aggregation

2.7.1 Overview

Link Aggregation

Ethernet link aggregation, most often simply called link aggregation, aggregates multiple physical Ethernet links into one logical link to increase link bandwidth beyond the limits of any one single link. This logical link is called an aggregate link. It allows for link redundancy because the member physical links dynamically back up one another.

As shown in Figure 2-11, Switch A and Switch B are connected with three physical Ethernet links. These physical Ethernet links are aggregated into an aggregate link, Link aggregation 1. The

bandwidth of this aggregate link can be as high as the total bandwidth of these three physical Ethernet links.

Figure 2-11 Port Isolate page

LACP

The IEEE 802.3ad Link Aggregation Control Protocol (LACP) enables dynamic aggregation of physical links. It uses link aggregation control protocol data units (LACPDUs) for exchanging aggregation information between LACP-enabled devices.

There are two link aggregation modes: dynamic and static. Dynamic link aggregation uses LACP while static link aggregation does not. A link aggregation group operating in static mode is called a static link aggregation group, while a link aggregation group operating in dynamic mode is called a dynamic link aggregation group.

2.7.2 Configuring an Aggregation Group

Configuration procedure:

1. Select Interface > Link Aggregation in the navigation area to enter the Link Aggregation page as shown in [Figure 2-12](#), The description of the link aggregation is described in [Table 2-6](#).

Figure 2-12 Global Configure Page

Name	Value	Apply
Load balancing method	<u>src-dst-mac</u> ▼	✓ APPLY

Table 2-6 description of global configure item

Item	Dedcription
------	-------------

Global Configuration	Name	Load balancing method	
	Value	dst-mac	Equalize according to the destination MAC address
		src-mac	Equalize according to the source MAC address
		src-dst-mac	Equalize according to the destination MAC address and source MAC address
		dst-ip	Equalize according to the destination IP address
		srt-ip	Equalize according to the source IP address
		src-dst-ip	Equalize according to the destination IP address and source IP address

2.7.3 Configuration Example

1. Network Requirements

- As shown in [Figure 2-15](#), aggregate the ports on each device to form a link aggregation group, balancing incoming/outgoing traffic across the member ports
- You can create a static or dynamic link aggregation group to achieve load balancing.

Figure 2-15 Network diagram

2. Configure procedure

Approach 1: Create static link aggregation

1. Select interface > Link aggregation from the navigation area to enter the Global Configuration page.
2. In the Global Configuration page, select the src-ip option for the load balancing method, click Apply to complete the configuration, as shown in [Figure 2-16](#).

Figure 2-16 Global Configuration

Name	Value	Apply
Load balancing method	src-ip	✓ APPLY

3. In the Aggregation Member area, check the box in front of the gigabitEthernet0/1, gigabitEthernet0/2, gigabitEthernet0/3, click the EDIT button to enter the page as shown in [Figure 2-17](#).
 1. Set the ID '1' .
 2. Select the Manual option for the Mode.
 3. Click Apply.

2.8 PoE Management

2.8.1 PoE Overview

Power over Ethernet (PoE) means that power sourcing equipment (PSE) supplies power to powered devices (PDs) from Ethernet interfaces through twisted pair cables.

2.8.2 PoE Configuration

NOTE:

- Before configure PoE, make sure that the PoE power supply and PSE are operating normally; otherwise, you cannot configure PoE or the configured PoE function does not take effect.

1. Select Interface > PoE Management in the navigation area to enter the PoE Management page as shown in [Figure 2-22](#), the [Table 2-9](#) describes the items of PoE Global Configuration.

2. Type the max power supply in the Power supply text.

Figure 2-22 PoE Global Configuration

3 L2-Switch

3.1 VLAN

3.1.1 Introduction

Ethernet is a network technology based on the Carrier Sense Multiple Access/Collision Detect (CSMA/CD) mechanism. As the medium is shared, collisions and excessive broadcasts are common on an Ethernet. To address the issue, virtual LAN (VLAN) was introduced. The idea is to break a LAN down into separate VLANs, that is, Layer 2 broadcast domains whereby frames are switched between ports assigned to the same VLAN. VLANs are isolated from each other at Layer 2. A VLAN is a bridging domain, and all broadcast traffic is contained within it, as shown in [Figure 3-1](#).

Figure 3-1 A VLAN diagram

A VLAN is logically divided on an organizational basis rather than on a physical basis. For example, all workstations and servers used by a particular workgroup can be connected to the same LAN, regardless of their physical locations. VLAN technology delivers the following benefits:

- Confining broadcast traffic within individual VLANs. This reduces bandwidth waste and improves network performance.
- Improving LAN security. By assigning user groups to different VLANs, you can isolate them at Layer 2. For hosts in different VLANs to communicate, routers or Layer 3 switches are required.

- Flexible virtual workgroup creation. As users from the same workgroup can be assigned to the same VLAN regardless of their physical locations, network construction and maintenance is much easier and more flexible.

You can create VLANs based on:

- Port
- MAC address
- Protocol
- IP subnet
- Policy
- Other criteria

Because the Web interface is available only for port-based VLANs, this chapter introduces only port-based VLANs.

3.1.1.1 VLAN Mode

Depending on the tag handling mode, the VLAN Mode of a port can be one of the following three:

- **Access :**

An access port belongs to only one VLAN and usually connects to a user device.

- **Trunk :**

A trunk port can join multiple VLANs to receive and send traffic for them. It usually connects to a network device.

- **Hybrid :**

A hybrid port can join multiple VLANs to receive and send traffic for them. It can connect either a user device or a network device.

A hybrid port is different from a trunk port in that:

- A hybrid port allows traffic of multiple VLANs to pass through untagged.
- A trunk port allows only traffic of the default VLAN to pass through untagged.

3.1.1.2 Port link type

By default, VLAN 1 is the default VLAN for all ports. However, you can change the default VLAN for a port as required. When doing that, follow these guidelines:

- Because an access port can join only one VLAN, its default VLAN is the VLAN to which it belongs and cannot be configured.
- Because a trunk or hybrid port can join multiple VLANs, you can configure a default VLAN for the port.

3.1.1.3 Frame handling methods

Table 3-1 A port configured with a default VLAN handles a frame as follows:

Port type	Actions (in the inbound direction)		Actions (in the outbound direction)
	Untagged frame	Tagged frame	
Access	Tag the frame with the default VLAN tag.	<ul style="list-style-type: none"> • Receive the frame if its VLAN ID is the same as the default VLAN ID • Drop the frame if its VLAN ID is different from the default VLAN ID. 	Remove the default VLAN tag and send the frame.
Trunk	Check whether the default VLAN is carried on the port: <ul style="list-style-type: none"> • If yes, tag the frame with the default VLAN tag. • If not, drop the frame. 	<ul style="list-style-type: none"> • Receive the frame if its VLAN is carried on the port. • Drop the frame if its VLAN is not carried on the port. 	<ul style="list-style-type: none"> • Remove the tag and send the frame if the frame Carries the default VLAN tag. • Send the frame without removing the tag if its VLAN is carried on the port but is different from the default one.
Hybrid			Send the frame if its VLAN is carried on the port. The frame is sent with the VLAN tag removed or intact depending on your configuration.

3.1.2 Configuring a VLAN

3.1.2.2 Creating a VLAN

1. Select L2 Switch > VLAN in the navigation area. The system automatically enters the page as shown in [Figure 3-2](#).

Figure 3-2 VLAN configuration page

<input type="checkbox"/>	ID	Name	Tagged Members	Untagged Members	Edit
<input type="checkbox"/>	1	default	gigabitEthernet0/1, gigabitEthernet0/2, gigabitEthernet0/3, gigabitEthernet0/4, gigabitEthernet0/5, gigabitEthernet0/6, gigabitEthernet0/7, gigabitEthernet0/8, gigabitEthernet0/9, gigabitEthernet0/10		EDIT

	Hybrid	Sets the port's VLAN Mode to hybrid
PVID		Set the port's default VLAN ID •The trunk ports at the two ends of a link must have the same PVID. Otherwise, the link cannot properly transmit packets
Native Vlan		VLAN (Native Vlan) , only exist in Trunk mode.

4. Click the Save in the navigation area to save the configuration.

3.2 QinQ

3.2.1 Overview

Introduction to QinQ

QinQ stands for 802.1Q in 802.1Q. QinQ is a flexible, easy-to-implement Layer 2 VPN technology based on IEEE 802.1Q. QinQ enables the edge device on a service provider network to insert an outer VLAN tag in the Ethernet frames from customer networks, so that the Ethernet frames travel across the service provider network (public network) with double VLAN tags. QinQ enables a service provider to use a single SVLAN to serve customers who have multiple CVLANs.

Background and benefits

The IEEE 802.1Q VLAN tag uses 12 bits for VLAN IDs. A device supports a maximum of 4094 VLANs. This is far from enough for isolating users in actual networks, especially in metropolitan area networks (MANs).

By tagging tagged frames, QinQ expands the available VLAN space from 4094 to 4094×4094 .

QinQ delivers the following benefits:

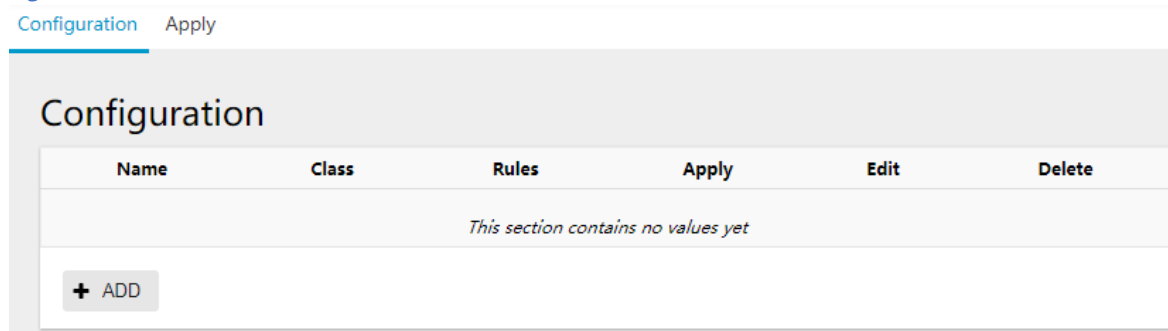

- Releases the stress on the SVLAN resource.
- Enables customers to plan their CVLANs without conflicting with SVLANs.
- Provides an easy-to-implement Layer 2 VPN solution for small-sized MANs or intranets.
- Allows the customers to keep their VLAN assignment schemes unchanged when the service provider upgrades the service provider network.

3.2.2 QinQ configuration

Creating a QinQ rule

1. Select L2 Switch > QinQ in the navigation area. The system automatically enters the page as shown in [Figure 3-6](#). [Table 3-4](#) describes the items of configuring a QinQ rule.

3.3 ERPS

3.2.1 Overview

The ITU-T G.8032 ERPS feature implements protection switching mechanisms for Ethernet layer ring topologies. This feature uses the G.8032 Ethernet Ring Protection (ERP) protocol, defined in ITU-T G.8032, to provide protection for Ethernet traffic in a ring topology, while ensuring that no loops are within the ring at the Ethernet layer. The loops are prevented by blocking traffic on either a predetermined link or a failed link.

Initial State

As the following figure, the devices on the ring have been configured, and all the link status is up. The RPL owner interface will be blocked by ERPS protocol to prevent loops. If a RPL neighbour interface is configured, it will also be blocked. Other interfaces are under the forwarding state, can forward the traffic.

Link failure

When there is a link failure between SwitchD and SwitchE, the two interfaces on the link will be blocked by ERPS protocol, the RPL owner interface will be forwarded.

Figure 1 Link failure

Link restores

When the failure link is restored. When the erps ring is configured to revertive mode, the RPL owner interface will be blocked by ERPS protocol, the restored link will be configured to forwarding state to forward traffic.

Single-Ring:

Only one ring in a network topology needs to be protected.

In [Figure 3-10](#), the network topology has only one ring, only one ring protection link (RPL) owner node, and only one RPL. All nodes must belong to the same ring automatic protection switching (R-APS) virtual local area network (VLAN).

- All devices in the ring network must support ERPS.
- The links between devices in the ring network must be directly connected, and there must be no intermediate devices.

Figure 3-10 ERPS single ring

Tangent Rings:

The two rings in a network topology that share one device need to be protected.

In [Figure 3-11](#), the two rings in the network topology share one device. Each ring has only one RPL owner node and only one RPL. The two rings belong to different R-APS VLANs.

- All devices in the ring network need to support ERPS.
- The links between devices in the ring network must be directly connected, and there must be no intermediate devices.

Figure 3-11 ERPS Tangent Rings

Intersecting Rings:

Two or more rings in a network topology share one link. (Each link between intersecting nodes must be a direct link without any intermediate node.)

In [Figure 3-12](#), four rings exist in the network topology. Each ring has only one PRL owner node and only one RPL. The four rings belong to different R-APS VLANs.

- All devices in the ring network need to support ERPS.
- The links between devices in the ring network must be directly connected, and there must be no intermediate devices.

Figure 3-12 ERPS Intersecting Rings

3.2.3 Configure the ERPS

3.2.3.1 ERPS summary

Select L2 Switch > ERPS in the navigation area to enter the erps summary page as shown in

[Figure 3-13](#), The description of the ERPS summary is described in [Table 3-6](#).

3.2.3.3 ERPS instance configuration

Select L2 Switch > ERPS > Configuration > ERPS Instance Configuration, click +Add to create an erps instance, as shown in [Figure 3-16](#). The description of the ERPS Instance Configuration summary is described in [Table 3-8](#).

Figure 3-16 ERPS Instance Configuration

ERPS Instance Configuration

Name	1
ID	0
Ring ID	1
Level	0
	Optional
RAPS Vlan	1000
	Only one vlan can be set here
Owner Interface	None
Sub-ring Block Interface	None

Table 3-8 Description of the ERPS Instance Configuration

Item	Description
Name	Instance name, in string format, unique, such as '1' or 'aa'
ID	Configure the VLAN Instance protected by the ERPS instance. By default, all VLANs belong to Instance 0. The default id is 0.

Ring ID	The associated ring ID must be the ring that has been created.
Level	ERPS priority, default is 0
RAPS VLAN	Each switch in the same ring must be configured with the same RAPS management VLAN for transmitting ERPS protocol packets. The RAPS management VLAN can be a virtual VLAN and needs to be distinguished from the data VLAN. It does not need to be created.
Ownerinterface	ERPS Owner interface can select either the east interface or the west interface as the Owner node. Each ERPS ring has one and only one interface configured as an RPL owner interface that controls the ports that need to be blocked.
Sub-ring Block Interface	The subring 's blocked interface, one subring has only one blocking port. You can choose east or west. This parameter needs to be configured only for the tangent ring. The sub-rings of the two devices with tangent to the ring must be configured with the sub-ring blocking port.
Attached Instance	It only needs to be set when the sub-ring blocking port needs to be configured, and is set to the ring ID that is tangent to the current sub-ring.

3.2.4 Single-ring configuration example

Network Requirements:

In [Figure 3-17](#), switches make up a ring network. Data traffic VLAN is 1-3. The backup link by default is between SWITCH 1 and SWITCH 2. If any link is failure, the network can recover quickly by forwarding the backup link.

Figure 3-17 ERPS network diagram

3.2.4.1 Configure Device S1

1. Configure the ports as trunk ports.

Select L2 Switch > VLAN > Interface, select gigabitEthernet0/9 and gigabitEthernet0/10, click Edit button to enter the interface configuration page. As shown in [Figure 3-18](#), configure the Vlan mode of gigabitEthernet0/9 and gigabitEthernet0/10 in the Ethernet ring, Native Vlan is the default value 1.

Figure 3-18 Interface configuration page

Interface

Name: gigabitEthernet0/9, gigabitEthernet0/10

Vlan Mode: Trunk

Native Vlan: 1

5. Click Save in the navigation area to save the configuration

NOTE:

- Different from S1, S2 and S3 configure the Owner interface = None.

3.4 IGMP Snooping

Internet Group Management Protocol Snooping (IGMP snooping) is a multicast constraining mechanism that runs on Layer 2 devices to manage and control multicast groups.

3.3.1 Principle of IGMP snooping

By analyzing received IGMP messages, a Layer 2 device running IGMP snooping establishes mappings between ports and multicast MAC addresses and forwards multicast data based on these mappings. As shown in [Figure 3-27](#), when IGMP snooping is not running on the switch, multicast packets are flooded to all devices at Layer 2. However, when IGMP snooping is running on the switch, multicast packets for known multicast groups are multicast to the receivers, rather than broadcast to all hosts, at Layer 2.

Figure 3-27 Multicast forwarding before and after IGMP snooping runs

3.3.2 Configure the IGMP Snooping

3.3.2.1 IGMP Snooping Summary

Select L2 Switch > IGMP Snooping > Summary in the navigation area to enter the summary page, as shown in [Figure 3-28](#). [Table 3-9](#) describes the IGMP snooping configuration items.

3.5 Spanning Tree

3.4.1 Overview

Spanning Tree Protocol (STP) is a Layer-2 management protocol. It cannot only selectively block redundant links to eliminate Layer-2 loops but also can back up links.

Like many protocols, STP is continuously updated from Rapid Spanning Tree Protocol (RSTP) to Multiple Spanning Tree Protocol (MSTP) as the network develops.

For the Layer-2 Ethernet, only one active link can exist between two local area networks (LANs). Otherwise, a broadcast storm will occur. To enhance the reliability of a LAN, it is necessary to establish a redundant link and keep some paths in backup state. If the network is faulty and a link fails, you must switch the redundant link to the active state. STP can automatically activate the redundant link without any manual operations. STP enables devices on a LAN to:

- Discover and start the best tree topology on the LAN.
- Troubleshoot a fault and automatically update the network topology so that the possible best tree topology is always selected.

The LAN topology is automatically calculated based on a set of bridge parameters configured by the administrator. The best topology tree can be obtained by properly configuring these parameters.

RSTP is completely compatible with 802.1D STP. Like traditional STP, RSTP provides loop-free and redundancy services. It is characterized by rapid speed. If all bridges in a LAN support RSTP and are properly configured by the administrator, it takes less than 1 second (about 50 seconds if traditional STP is used) to re-generate a topology tree after the network topology changes.

STP and RSTP have the following defects:

- STP migration is slow. Even on point-to-point links or edge ports, it still takes two times of the forward delay for ports to switch to the forwarding state.
- RSTP can rapidly converge but has the same defect with STP: Since all VLANs in a LAN share the same spanning tree, packets of all VLANs are forwarded along this spanning tree. Therefore, redundant links cannot be blocked according to specific VLANs and data traffic cannot be balanced among VLANs.
- MSTP, defined by the IEEE in 802.1s, resolves defects of STP and RSTP. It cannot only rapidly converge but also can enable traffic of different VLANs to be forwarded along respective paths, thereby providing a better load balancing mechanism for redundant links.

In general, STP/RSTP works based on ports while MSTP works based on instances. An instance is a set of multiple VLANs. Binding multiple VLANs to one instance can reduce the communication overhead and resource utilization.

3.4.2 Spanning Tree Configuring

Display the Summary of the Spanning Tree

Select L2 Switch > Spanning Tree > Summary in the navigation area to enter the summary page, as shown in [Figure 3-34](#). [Table 3-13](#) describes the Spanning Tree Summary items.

BPDU Guard	Configure the interface to enable BPDU protection.

3.6 MAC Management

3.5.1 Overview

A device maintains a MAC address table for frame forwarding. Each entry in this table indicates the MAC address of a connected device, to which interface this device is connected and to which VLAN the interface belongs. A MAC address table consists of two types of entries: static and dynamic. Static entries are manually configured and never age out. Dynamic entries can be manually configured or dynamically learned and will age out.

Your device learns a MAC address after it receives a frame from a port, port A for example, as it executes the following steps.

1. Checks the frame for the source MAC address (MAC-SOURCE for example).
2. Looks up the MAC address table for an entry corresponding to the MAC address and do the following:
 - If an entry is found for the MAC address, updates the entry.
 - If no entry containing the MAC address is found, adds an entry that contains the MAC address and the receiving port (port A) to the MAC address table.

3. After the MAC address (MAC-SOURCE) is learned, if the device receives a frame destined for MAC-SOURCE, the device looks up the MAC address table and then forwards the frame from port A.

When forwarding a frame, the device adopts the following forwarding modes based on the MAC address table:

- Unicast mode: If an entry matching the destination MAC address exists, the device forwards the frame directly from the sending port recorded in the entry.
- Broadcast mode: If the device receives a frame with the destination address being all Fs, or no entry matches the destination MAC address, the device broadcasts the frame to all the ports except the receiving port.

Figure 3-39 MAC address table of the device

3.5.2 Configuring MAC addresses

MAC addresses configuration includes the configuring and displaying of static MAC address, Filter MAC Address, and the setting of MAC address entry aging time.

Configuring a static MAC address

1. Select L2 Switch > MAC Mangement > Static MAC Address from the navigation area. The system automatically displays the Static MAC Address page, as shown in [Figure 3-40](#).
2. Click +Add to enter the page for creating static MAC address, as shown in [Figure 3-41](#). [Table 3-18](#) shows the detailed configuration for creating a static MAC address.

3. Type in MAC address, for example '00eb.fc00.8877' , select the VID in the VLAN drop down list, select the Interface in the Interface drop list.
4. Click Apply to end the operation.

3.7 LLDP

3.7.1 Overview

In a heterogeneous network, a standard configuration exchange platform ensures that different types of network devices from different vendors can discover one another and exchange configuration.

The Link Layer Discovery Protocol (LLDP) is specified in IEEE 802.1AB. The protocol operates on the data link layer to exchange device information between directly connected devices. With LLDP, a device sends local device information as TLV (type, length, and value) triplets in LLDP Data Units (LLDPDUs) to the directly connected devices. Local device information includes its system capabilities, management IP address, device ID, port ID, and so on. The device stores the device information in LLDPDUs from the LLDP neighbors in a standard MIB. LLDP enables a network management system to quickly detect and identify Layer 2 network topology changes.

3.7.2 Configuring LLDP

LLDP global Configuration

Select L2 Switch > LLDP > Global Configuration in the navigation area to enter the Global Configuration page, as shown in Figure 3-47. Table 3-21 describes the Global Configuration items.

Table 3-22 LLDP port Configuration Items

Item	Description
Description	Description of the currently configured LLDP port
Agent Circuit ID	Agent circuit identification. Can be used as a value for port-id-tlv
Locally Assigned	Locally Assigned
Admin Status	Disabled: No LLDP packets are sent/receive on the interface TxOnly: LLDP packets are sent on the interface RxOnly: LLDP packets are received on the interface TxRx: LLDP packets are sent/receive on the interface
Chassis Subtype	Mac-address: indicates the MAC address If-alias: Indicates the interface alias

	<p>If-name: indicates the interface name</p> <p>Ip-address: Indicates the IP address</p> <p>Locally-assigned: indicates local configuration</p>
Port ID Subtype	<p>Mac-address: indicates the MAC address</p> <p>If-alias: Indicates the interface alias</p> <p>If-name: indicates the interface name</p> <p>Ip-address: Indicates the IP address</p> <p>Agt -circuit-id: Indicates the agt-circuit-id</p> <p>Locally-assigned: indicates locally-assigned value</p>
Management Address Subtype	<p>Mac-address: Device MAC address</p> <p>Ip-address: Device IP address</p>
Basic Tlvs	<p>port-description: port descriptor</p> <p>system-description: system descriptor</p> <p>management-address: management address</p> <p>system-name: system name</p> <p>system-capabilities: system capabilities</p>
802.1 Tlvs	<p>port-vlanid: port's vlanid</p> <p>ptcl -identity: protocol id</p> <p>vid-digest: vid digest</p> <p>vlan-name: vlan name</p> <p>port-ptcl - vlanid: port protocol vlanid</p> <p>link- agg mgmt -vid: Link Aggregation Management vid</p>
802.3 Tlvs	<p>mac-phy: The rate and duplex status supported by the port, whether it supports port rate auto-negotiation, whether the auto-negotiation function is enabled, and the current rate and duplex status</p> <p>max - mtu -size: maximum mtu value</p>
Tx hold	<p>Transmission hold, the default value txFastInit is 4, used for packet TTL calculation; $TTL = msgTxInterval * msgTxHold + 1$</p>

Tx interval	Transfer intervals, default is 30 s; admin can change this value to any value between 5 and 300.
Reinit delay	Indicates the amount of delay between when adminStatus becomes 'disabled' and when reinitialization is attempted. The default value of reinitDelay is 2 s.
Fast tx	Defines the time interval for the timer interval between two transfers within a fast transfer period (ie txFast is not zero). The default value for msgFastTx is 1; administrators can change this value to any value between 1 and 3600.
Tx fast init	This variable is used as the initial value of the txFast variable. This value determines the number of LLDPDUs transmitted during the fast transmission period.
Tx credit max	Configure the maximum value of txCredit. The default value is 5. Administrators can change this value to any value in the range 1 to 10.

[View statistics](#)

Select L2 Switch > LLDP > statistics in the navigation area to enter the LLDP port setting page, as shown in [Figure 3-50](#). [Table 3-23](#) describes the Global Configuration items.

4 Security

4.1 ACL

4.1.1 Overview

An access control list (ACL) is a set of rules (or permit or deny statements) for identifying traffic based on criteria such as source IP address, destination IP address, and port number. ACLs are essentially used for packet filtering. A packet filter drops packets that match a deny rule and permits packets that match a permit rule. ACLs are also widely used by many modules, for example, QoS and IP routing, for traffic identification.

NOTE:

- Unless otherwise stated, ACLs refer to IPv4 ACLs throughout this document.

4.1.2 Configuring Acls

Configuring a rule for a basic IP ACL

1. Select Security > ACL from the navigation tree.
2. Click the +ADD to enter the rule configuration page and choose the ACL type 'IP' for a basic ACL as shown in [Figure 4-1](#). [Table 4-1](#) describes the configuration items of configuring an IP ACL.

Figure 4-1. Configuring a basic IP ACL

ACL Rule

ACL Type	IP
Name	<div>IP standard ACL: enter a number from 1 to 99 or 1300 to 1999.</div>
Type	Permit
Source	
Source Mask	

Table 4-1 The description of the basic IP ACL

Item		Description
ACL Type	IP	ACL of Standard IP

Name		The number of the rule, Between 1-99 or 1300-1999
Type	Permit	Allows matched packets to pass
	Deny	Drops matched packets
Source		Source IP address, such as 192.168.1.1
Source Mask		The IP mask is reversed. If it matches the first 24 bits of the IP address, the mask is 255.255.255.0, which needs to be set to 00.00.00.255 here.

3. Configure a rule for a basic ACL, and click Apply.

4. Click Apply tab to enter the ACL port configuration page, choose the ACL rules of the corresponding port, as shown in [Figure 4-2](#), and click Apply.

Figure 4-2 Apply the ACL rule to the port

Name	In	Apply
gigabitEthernet0/1	1	✓ APPLY
gigabitEthernet0/2		✓ APPLY
gigabitEthernet0/3		✓ APPLY

Configuring a rule for an IP-Extend ACL

1. Select Security > ACL from the navigation tree.

2. Click the +ADD to enter the rule configuration page and choose the ACL type 'IP-Extend' for an IP-Extend ACL as shown in [Figure 4-3](#). [Table 4-2](#) describes the configuration items of configuring an IP-Extend ACL.

Table 4-2 The description of the IP-Extend ACL

Item		Description
ACL Type	IP-Extend	Extend ACL, Match the protocol number, source IP address, and destination IP address of IPv4 packets.
Name		The number of the rule, Between 100-199 or 2000-2699.
Type	Permit	Allows matched packets to pass
	Deny	Drops matched packets
Protocol		Support common protocol message options, including tcp, udp, vrrp, igmp, gre, ipcomp, ospf, pim, rsvp, etc. Support all IPv4 packets IPv4 packets that support custom protocols
Source		Source IP address, such as 192.168.1.1
Source mask		The IP mask is reversed. If it matches the first 24 bits of the IP address, the mask is 255.255.255.0, which needs to be set to 00.00.00.255 here.
Destination		Destination IP address, such as 192.168.1.100
Destination mask		Enter a value to specify the subnet mask for the destination IP address. The IP mask is reversed.

- Configure a rule for a basic ACL, and click Apply.
- Click Apply tab to enter the ACL port configuration page, choose the ACL rules of the corresponding port, and click Apply.

Configuring a rule for a MAC-Extend ACL

1. Select Security > ACL from the navigation tree.
2. Click the +ADD to enter the rule configuration page and choose the ACL type 'MAC-Extend' for a MAC-Extend ACL as shown in Figure 4-4. Table 4-3 describes the configuration items of configuring a MAC-Extend ACL.

Figure 4-4. Configuring a MAC-Extend ACL

Type	Permit	Allows matched packets to pass
	Deny	Drops matched packets
Source		Source IP address, such as 192.168.1.1
Source mask		The IP mask is reversed. If it matches the first 24 bits of the IP address, the mask is 255.255.255.0, which needs to be set to 00.00.00.255 here.
Destination		Destination IP address, such as 192.168.1.100
Destination mask		Enter a value to specify the subnet mask for the destination IP address. The IP mask is reversed.

3. Configure a rule for a basic ACL, and click Apply.
4. Click Apply tab to enter the ACL port configuration page, choose the ACL rules of the corresponding port, and click Apply.

Configuring a rule for an IP-Name ACL

1. Select Security > ACL from the navigation tree.
2. Click the +ADD to enter the rule configuration page and choose the ACL type 'IP-Named' for an IP-Named ACL, as shown in Figure 4-5. Table 4-4 describes the configuration items of configuring a IP-Named ACL.

Figure 4-5. Configuring an IP-Named ACL

The screenshot shows the 'ACL Rule' configuration page. The 'ACL Type' is set to 'IP-Named'. The 'Name' field is empty, with a hint: 'IP named ACL: enter ACL names instead of numbers.' The 'Type' is set to 'Permit'. The 'Source' and 'Source Mask' fields are also empty.

Table 4-4 The description of the IP-Named ACL

Item		Description
ACLType	IP-Named	Standard ACL, support name naming, the first character must be a letter
Name		String starting with a letter
Type	Permit	Allows matched packets to pass
	Deny	Drops matched packets
Source		Source IP address, such as 192.168.1.1
Source mask		The IP mask is reversed. If it matches the first 24 bits of the IP address, the mask is 255.255.255.0, which needs to be set to 00.00.00.255 here.

3. Configure a rule for a basic ACL, and click Apply.
4. Click Apply tab to enter the ACL port configuration page, choose the ACL rules of the corresponding port, and click Apply.

Configuring a rule for an IP-Name-Extend ACL

1. Select Security > ACL from the navigation tree.
2. Click the +ADD to enter the rule configuration page and choose the ACL type 'IP-Name-Extend' for an IP-Name-Extend ACL as shown in Figure 4-6. Table 4-5 describes the configuration items of configuring an IP-Name-Extend ACL.

	Deny	Drops matched packets
Protocol		Support common protocol message options, including tcp, udp, vrrp, igmp, gre, ipcomp, ospf, pim, rsvp, etc. Support all IPv4 packets IPv4 packets that support custom protocols
Source		Source IP address, such as 192.168.1.1
Source mask		The IP mask is reversed. If it matches the first 24 bits of the IP address, the

	mask is 255.255.255.0, which needs to be set to 00.00.00.255 here.
Destination	Destination IP address, such as 192.168.1.100
Destination mask	Enter a value to specify the subnet mask for the destination IP address. The IP mask is reversed.

3. Configure a rule for a basic ACL, and click Apply.

4. Click Apply tab to enter the ACL port configuration page, choose the ACL rules of the corresponding port, and click Apply.

4.2 QoS

4.2.1 Overview

Quality of Service (QoS) reflects the ability of a network to meet customer needs. In an internet, QoS evaluates the ability of the network to forward packets of different services. The evaluation can be based on different criteria because the network may provide various services. Generally, QoS performance is measured with respect to bandwidth, delay, jitter, and packet loss ratio during packet forwarding process.

4.2.2 Configuring Qos

Qos global Configuration

Select Security > Qos > Summary in the navigation area to enter the QoS summary page, as shown in [Figure 4-7](#). [Table 4-6](#) describes the QoS summary items.

4.3 DHCP Snooping

4.3.1 Overview

DHCP snooping (Dynamic Host Configuration Protocol) is a security feature that acts like a firewall between untrusted hosts and trusted DHCP servers. When DHCP snooping is enabled on a VLAN, the system examines DHCP messages sent from untrusted hosts associated with the VLAN and extracts their IP addresses and lease information. This information is used to build and maintain the DHCP snooping database.

DHCP snooping is enabled on a per-VLAN basis. By default, the feature is inactive on all VLANs. You can enable the feature on a single VLAN or a range of VLANs.

Trusted Sources

The DHCP snooping feature determines whether traffic sources are trusted or untrusted. DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server. The default trust state of all interfaces is untrusted.

DHCP Snooping Limit Rate

Configure the number of DHCP packets per second that an interface can receive, to reduce or eliminate the impact of DHCP packet attack from this interface.

MAC Address Verification

With DHCP snooping MAC address verification enabled, DHCP snooping verifies that the source MAC address and the client hardware address match in DHCP packets that are received on untrusted ports. The source MAC address is a Layer 2 field associated with the packet, and the client hardware address is a Layer 3 field in the DHCP packet.

Option-82 Insertion

DHCP Option82 option is also called DHCP relay agent information option, one of many dhcp options. The Option82 option is a DHCP option proposed to enhance the security of the DHCP

server and improve the IP address allocation strategy. The addition and stripping of options are implemented by the relay component.

DHCP Database

The DHCP snooping feature dynamically builds and maintains the database using information extracted from intercepted DHCP messages. The database contains an entry for each untrusted host with a leased IP address if the host is associated with a VLAN that has DHCP snooping enabled. The database does not contain entries for hosts connected through trusted interfaces. When the Ip verify source function is enabled on the interface, database entries act as valid users on the interface.

4.3.2 Configuring DHCP Snooping

Configuring DHCP Snooping globally

1. Select Security > DHCP Snooping from the navigation tree.
2. Click the Global Configuration tap of the current page to enter the page, as shown in [Figure 4-13](#).
3. [Table 4-12](#) describes the configuration items of configuring DHCP Globally.

Figure 4-13 DHCP Snooping global configuration

[Global Configuration](#) [Interface Configuration](#) [Database](#)

Global Configuration

Status	<div>Enable</div>
Vlan	<div>1-4094</div> <div>Eg. 1-3,5 6 means vlan 1,2,3,5,6</div>
Verify mac-address	<div>Disable</div>
Information option-82	<div>Disable</div>
Database write-delay (second)	<div></div>

Table 4-12 The description of DHCP Snooping global configuration

Item	Description
Status	Enable/Disable the DHCP Snooping globally
Vlan	Enable/Disable the DHCP Snooping on the vlans

Vefify mac-address	Verify the source MAC address and the client hardware address is matched in DHCP packets
Information option-82	Enable/Disable option-82 insertion
Database write-delay(s)	Configure the interval time database writing to flash

Configuring DHCP Snooping ports

1. Select Security > DHCP Snooping from the navigation tree.
2. Click the Interface Configuration tap of the current page to enter the DHCP Snooping interfae configuration status page, as shown in [Figure 4-14](#).

Figure 4-14 DHCP Snooping interfae configuration status

Global Configuration	Interface Configuration	Database
----------------------	-------------------------	----------

Interface Configuration			
<input type="checkbox"/>	Name	Trust	Ratelimit
<input type="checkbox"/>	gigabitEthernet0/1	Disable	-
<input type="checkbox"/>	gigabitEthernet0/2	Disable	-
<input type="checkbox"/>	gigabitEthernet0/3	Disable	-
<input type="checkbox"/>	gigabitEthernet0/4	Disable	-

3. Check the ports to be configured, click EDIT to enter the interface configuration page as shown in [Figure 4-15](#). [Table 4-13](#) describes the configuration items of configuring DHCP snooping interface configuration.

Figure 4-15 DHCP Snooping global configuration

Interface Configuration	
Interface	gigabitEthernet0/1 ...(1,2)
Trust	Disable ▼
Ratelimit(pps)	<input type="text"/>

Table 4-13 The description of DHCP snooping interface configuration

Item	Description
Trust	determines whether traffic sources are trusted or untrusted

Ratelimit(pps)	Configure the number of DHCP packets per second that an interface can receive
----------------	---

NOTE:

- ◆ Due to hardware limitations, for DHCP rate limit, when the limit value is not 0, the software rate limit is used, and when the limit value is 0, the hardware rate limit is used. Software rate limit will consume CPU resources.

Configuring DHCP Snooping database

1. Select Security > DHCP Snooping from the navigation tree.
2. Click the Database tab of the current page to enter the database page, as shown in [Figure 4-16](#). [Table 4-14](#) describes the configuration items of configuring DHCP Snooping database.

Figure 4-16 DHCP Snooping database

Table 4-14 The description of DHCP Snooping database

Item	Description
Search	Search database entries by fuzzy match the input strings
WRITE	Write database entries to flash
READ	Read database entries from flash
CLEAR	Clear database entries, you can narrow the scope by selecting keywords

4.4 802.1X Authentication

4.1.1 Overview

The 802.1X protocol was proposed by the IEEE 802 LAN/WAN committee for security of wireless LANs (WLAN). It has been widely used on Ethernet as a common port access control mechanism.

As a port-based access control protocol, 802.1X authenticates and controls accessing devices at the port level. A device connected to an 802.1X-enabled port of an access control device can access the resources on the LAN only after passing authentication.

4.4.1.1 Architecture of 802.1X

802.1X operates in the typical client/server model and defines three entities: Client, Device, and Server, as shown in below.

- Client is an entity seeking access to the LAN. It resides at one end of a LAN segment and is authenticated by Device at the other end of the LAN segment. Client is usually a user-end device such as a PC. 802.1X authentication is triggered when an 802.1X-capable client program is launched on Client. The client program must support Extensible Authentication Protocol over LAN (EAPOL).
- Device, residing at the other end of the LAN segment, authenticates connected clients. Device is usually an 802.1X-enabled network device and provides access ports (physical or logical) for clients to access the LAN.
- Server is the entity that provides authentication services to Device. Server, normally running RADIUS (Remote Authentication Dial-in User Service), serves to perform authentication, authorization, and accounting services for users.

4.4.1.2 Authentication modes of 802.1x

The 802.1X authentication system employs the Extensible Authentication Protocol (EAP) to exchange authentication information between the client, device, and authentication server. Client
Device Server

- Between the client and the device, EAP protocol packets are encapsulated using EAPOL to be transferred on the LAN.
- Between the device and the RADIUS server, EAP protocol packets can be exchanged in two modes: EAP relay and EAP termination. In EAP relay mode, EAP packets are encapsulated in EAP over RADIUS (EAPOR) packets on the device, and then relayed by device to the RADIUS server. In EAP termination mode, EAP packets are terminated at the device, converted to RADIUS packets either with the Password Authentication Protocol (PAP) or Challenge Handshake Authentication Protocol (CHAP) attribute, and then transferred to the RADIUS server.

4.4.1.3 Basic concepts of 802.1x

These basic concepts are involved in 802.1X: controlled port/uncontrolled port, authorized state/unauthorized state, and control direction.

Controlled port and uncontrolled port

A device provides ports for clients to access the LAN. Each port can be regarded as a unity of two logical ports: a controlled port and an uncontrolled port. Any packets arriving at the port are visible to both logical ports.

- The uncontrolled port is always open in both the inbound and outbound directions to allow EAPOL protocol packets to pass, guaranteeing that the client can always send and receive authentication packets.
- The controlled port is open to allow data traffic to pass only when it is in the authorized state.

Authorized state and unauthorized state

A controlled port can be in either authorized state or unauthorized state, which depends on the authentication result, as shown in [Figure 4-17](#).

Figure 4-17 Authorized/unauthorized state of a controlled port

You can control the port authorization status of a port by setting port authorization mode to one of the following:

- **Force-Authorized:** Places the port in authorized state, allowing users of the port to access the network without authentication.
- **Force-Unauthorized:** Places the port in unauthorized state, denying any access requests from users of the port.
- **Auto:** Places the port in the unauthorized state initially to allow only EAPOL packets to pass, and turns the port into the authorized state to allow access to the network after the users pass authentication. This is the most common choice.

Control direction

In the unauthorized state, the controlled port can be set to deny traffic to and from the client or just the traffic from the client.

802.1X authentication triggering

802.1X authentication can be initiated by either a client or the device.

Unsolicited triggering of a client

A client can initiate authentication unsolicitedly by sending an EAPOL-Start packet to the device. The destination address of the packet is 01-80-C2-00-00-03, the multicast address specified by the IEEE 802.1X protocol.

Some devices in the network may not support multicast packets with the above destination address, and unable to receive authentication requests of clients as a result. To solve this problem, the device also supports EAPOL-Start packets using a broadcast MAC address as the destination address.

Unsolicited triggering of the device

The device can trigger authentication by sending EAP-Request/Identity packets to unauthenticated clients periodically (every 30 seconds by default). This method can be used to authenticate clients that cannot send EAPOL-Start packets unsolicitedly to trigger authentication, for example, a client running the 802.1X client application provided by Windows XP.

Authentication process of 802.1x

An 802.1X device communicates with a remote RADIUS server in two modes: EAP relay and EAP termination. The following describes the 802.1X authentication procedure in the two modes, which is triggered by the client in the examples.

EAP relay

EAP relay is defined in IEEE 802.1X. In this mode, EAP packets are carried in an upper layer protocol, such as RADIUS, so that they can go through complex networks and reach the authentication server. Generally, relaying EAP requires that the RADIUS server support the EAP attributes of EAP-Message and Message-Authenticator, which are used to encapsulate EAP packets and protect RADIUS packets carrying the EAPMessage attribute respectively.

Figure 4-18 shows the message exchange procedure with EAP-MD5

1. When a user launches the 802.1X client software and enters the registered username and password, the 802.1X client software generates an EAPOL-Start frame and sends it to the device to initiate an authentication process.
2. Upon receiving the EAPOL-Start frame, the device responds with an EAPRequest/Identity packet for the username of the client.
3. When the client receives the EAP-Request/Identity packet, it encapsulates the username in an EAP-Response/Identity packet and sends the packet to the device.
4. Upon receiving the EAP-Response/Identity packet, the device relays the packet in a RADIUS Access-Request packet to the authentication server.
5. When receiving the RADIUS Access-Request packet, the RADIUS server compares the identify information against its user information table to obtain the corresponding password information. Then, it encrypts the password information using a randomly generated challenge, and sends the challenge information through a RADIUS Access-Challenge packet to the device.

6. After receiving the RADIUS Access-Challenge packet, the device relays the contained EAP-Request/MD5 Challenge packet to the client.
7. When receiving the EAP-Request/MD5 Challenge packet, the client uses the offered challenge to encrypt the password part (this process is not reversible), creates an EAP-Response/MD5 Challenge packet, and then sends the packet to the device.
8. After receiving the EAP-Response/MD5 Challenge packet, the device relays the packet through a RADIUS Access-Request packet to the authentication server.
9. When receiving the RADIUS Access-Request packet, the RADIUS server compares the password information encapsulated in the packet with that generated by itself. If the two are identical, the authentication server considers the user valid and sends to the device a RADIUS Access-Accept packet.
10. Upon receiving the RADIUS Access-Accept packet, the device opens the port to grant the access request of the client. After the client gets online, the device periodically sends handshake requests to the client to check whether the client is still online. By default, if two consecutive handshake attempts end up with failure, the device concludes that the client has gone offline and performs the necessary operations, guaranteeing that the device always knows when a client goes offline.
11. The client can also send an EAPOL-Logoff frame to the device to go offline unsolicitedly. In this case, the device changes the status of the port from authorized to unauthorized and sends an EAP-Failure packet to the client.

4.4.2 Configuring 802.1X

Displaying 802.1X Summary

Select Security > 802.1x Authentication > Summary from the navigation area. The system automatically displays the 802.1X summary, as shown in [Figure 4-19](#). [Table 4-15](#) describes the Spanning Tree Summary items.

Figure 4-19 The summary of the 802.1X

Summary

Configuration

<input type="checkbox"/>	eth0/1	Disabled	0	0	0	Disabled	0	0	0
<input type="checkbox"/>	eth0/2	Disabled	0	0	0	Disabled	0	0	0
<input type="checkbox"/>	eth0/3	Disabled	0	0	0	Disabled	0	0	0

Table 4-16 The 802.1X Configuration items

Item		Description
Global Configuration	Enable/Disable	Enables the 802.1X feature on your switch.
Port Configuration	Interface	Physical interface name
	Port Control	Port control mode
	Protocol Version	Eapol protocol version, default version 2
	Quiet Period(s)	Sets the number of seconds that the switch remains in the quiet-period following a failed authentication exchange with the client. The range is 0 to 65,535 seconds; the default is 60. When the switch cannot authenticate the client, the switch remains idle for a set period, and then tries again. The idle time is determined by the quiet-period value.
	Tx Period(s)	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65,535 seconds; the default is 30.
	ReAuth Enabled	Enables periodic reauthentication of the client
	ReAuth Period(s)	Specifies the number of seconds between reauthentication attempts or have the switch use a RADIUS-provided session timeout. The range is 1 to 65,535; the default is 3600 seconds. This command affects the behavior of the switch only if periodic reauthentication is enabled.

Supp Timeout(s)	Sets the number of seconds that the switch waits for a response to an EAP-Request/MD5 Challenge frame from the client before retransmitting the request. The range is 1 to 65,535 seconds; the default is 30.
Server Timeout(s)	Sets the number of seconds that the switch waits for a response to a RADIUS Access-Request packet from the server. The range is 1 to 65,535 seconds; the default is 30.

4.4.3 802.1X Configuration Example

Network requirements

- As shown in [Figure 4-22](#) the access user is authenticated on GigabitEthernet0/3 to control access to the Internet.
- The IP address of the RADIUS server group is 1.1.1.2.
- Set the shared key for the system to exchange packets with the RADIUS server as name.

Figure 4-22 802.1X Network diagram

Configuration procedure

1. Configuring the server

Server:

Configure NAS authentication device 1.1.1.1 and communication key name.

In this example, freeradius is used as the server. The main configuration is as follows:

```
# vim /etc/freeradius/3.0/clients.conf
```

Add

```
client 1.1.1.1 {  
    ipaddr = 1.1.1.1  
    secret = name  
}
```

Add the user account test password test.

```
# cat /etc/freeRADIUS/3.0/mods-config/files/authorize | grep 'password'
```

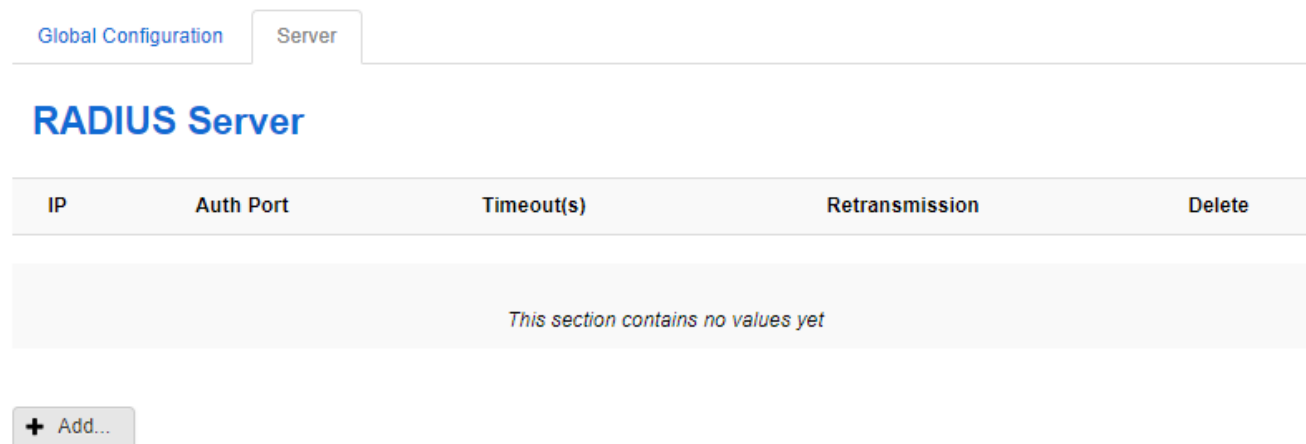

```
test Cleartext-Password: = 'test'
```

The sever should support the corresponding authentication method, such as EAP-MSCHAPv2.

2. Configure the RADIUS server

1) Select Security > RADIUS > Sever from the navigation area. The system automatically displays the RADIUS Sever Page, as shown in [Figure 4-23](#).

Figure 4-23 RADIUS Sever

2) Click the +Add button to enter the RADIUS Sever Configuration page as shown in [Figure 4-24](#).

Configure the IP '1.1.1.2' , the Auth port '1812' , tpye the password in the Key box, the timeout period is the default 5S, and the number of retransmissions is 3.

<input type="checkbox"/>	eth0/2	Disabled	0	0	0	Disabled	0	0	0
<input type="checkbox"/>	eth0/3	Auto	2	60	30	Disabled	3600	30	30

5. Configure the authentication client

Enable the 802.1X authentication client and log in using the account test.

The client should support the corresponding authentication method, such as the EAP-MSCHAPv2 method.

4.5 MAC Authentication

4.5.1 Overview

Authentication of MAC addresses is supported using a RADIUS server that contains a database of all valid users.

When the mac-auth option is enabled on any interface, all source MAC addresses from any incoming frame are sent for authentication. If the username and password of the source address are configured in the RADIUS server, then authentication succeeds, otherwise it fails. When authentication succeeds, the source MAC is added to the forwarding table with forwarding enabled. In the case of failure, the source MAC either is added to the forwarding table as discarded or is added to a restricted VLAN.

NOTE:

- If the configured static MAC is the same as the silent MAC, the MAC silent function after the MAC address authentication fails will be invalid.
-

4.5.2 Configuring MAC authentication

Displaying MAC Authentication Summary

Select Security > MAC Authentication > Summary from the navigation area. The system automatically displays the MAC Authentication summary, as shown in [Figure 4-29](#). [Table 4-17](#) describes the MAC Authentication Summary items.

5. Configure Client access automatic authentication

Start the client, access the network, and trigger MAC authentication.

4.6 RADIUS

4.6.1 Overview

Remote Authentication Dial-In User Service (RADIUS) is protocol for implementing Authentication, Authorization, and Accounting (AAA).

RADIUS is a distributed information interaction protocol using the client/server model. RADIUS can protect networks against unauthorized access and is often used in network environments where both high security and remote user access are required. RADIUS uses UDP, and its packet format and message transfer mechanism are based on UDP. It uses UDP port 1812 for authentication and 1813 for accounting.

RADIUS was originally designed for dial-in user access. With the diversification of access methods, RADIUS has been extended to support more access methods, for example, Ethernet access and ADSL access. It uses authentication and authorization in providing access services and uses accounting to collect and record usage information of network resources.

Client/server model

- Client: The RADIUS client runs on the NASs located throughout the network. It passes user information to designated RADIUS servers and acts on the responses (for example, rejects or accepts user access requests).
- Server: The RADIUS server runs on the computer or workstation at the network center and maintains information related to user authentication and network service access. It listens to connection requests, authenticates users, and returns the processing results (for example, rejecting or accepting the user access request) to the clients.

In general, the RADIUS server maintains three databases: Users, Clients, and Dictionary, as shown in [Figure 4-39](#).

Figure 4-39 RADIUS server components

- Users: Stores user information such as the usernames, passwords, applied protocols, and IP addresses.
- Clients: Stores information about RADIUS clients, such as the shared keys and IP addresses.
- Dictionary: Stores information about the meanings of RADIUS protocol attributes and their values.

Security and authentication mechanisms

Information exchanged between a RADIUS client and the RADIUS server is authenticated with a shared key, which is never transmitted over the network. This enhances the information exchange security. In addition, to prevent user passwords from being intercepted on insecure networks, RADIUS encrypts passwords before transmitting them.

A RADIUS server supports multiple user authentication methods, for example, the Password Authentication Protocol (PAP) and Challenge Handshake Authentication Protocol (CHAP) of the Point-to-Point Protocol (PPP). Moreover, a RADIUS server can act as the client of another AAA server to provide authentication proxy services.

Basic message exchange process of RADIUS

Figure 4-40 illustrates the interaction of the host, the RADIUS client, and the RADIUS server.

Figure 4-40 Basic message exchange process of RADIUS

The following is how RADIUS operates:

1. The host initiates a connection request carrying the username and password to the RADIUS client.

2. Having received the username and password, the RADIUS client sends an authentication request (Access-Request) to the RADIUS server, with the user password encrypted by using the Message-Digest 5 (MD5) algorithm and the shared key.
3. The RADIUS server authenticates the username and password. If the authentication succeeds, it sends back an Access-Accept message containing the user's authorization information. If the authentication fails, it returns an Access-Reject message.
4. The RADIUS client permits or denies the user according to the returned authentication result. If it permits the user, it sends a start-accounting request (Accounting-Request) to the RADIUS server.
5. The RADIUS server returns a start-accounting response (Accounting-Response) and starts accounting.
6. The user accesses the network resources.
7. The host requests the RADIUS client to tear down the connection and the RADIUS client sends a stop-accounting request (Accounting-Request) to the RADIUS server.
8. The RADIUS server returns a stop-accounting response (Accounting-Response) and stops accounting for the user.
9. The user stops access to network resources

NOTE:

- XPTN series switch do not support RADIUS accounting function
-

4.6.2 Configuring RADIUS

RADIUS global configuration

Select Security > RADIUS > Global Configuration from the navigation area. The system automatically displays the RADIUS Global Configuration, as shown in [Figure 4-41](#). [Table 4-19](#) describes the RADIUS Global Configuration items.

4.6.3 RADIUS Configuration Example

For details about RADIUS Configuration, refer to 4.1.3 802.1X Configuration Example

4.7 Port Security

4.7.1 Overview

The Port Security function restricts the number of valid MAC addresses on the port to limit the access of illegal users to the port. The illegal MAC packets will be directly discarded.

The legal MAC can be generated statically or dynamically. The static legal MAC is generated through user command line configuration; the dynamic legal MAC is dynamically generated through the MAC address learning function.

When the number of secure addresses on the port has reached the configured value of the maximum number of secure addresses, the new MAC access port will be recognized as an illegal MAC and a violation event will be generated. The user can configure the actions to be taken when the violation event occurs, respectively restrict or shutdown the port.

Restrict: Prohibit illegal MAC data from passing, and generate alarm log prompt information. Illegal MAC will prohibit access to the port within the MAC address aging time. It can be restored through shutdown and no shutdown ports.

Shutdown: The port is forced to be down, and the port recovery time can be configured. The port will automatically recover when the time is up; it can also be recovered by the shutdown, no shutdown command.

If you want to convert a dynamic security user to a static security user, you can enable the sticky function on the port. When the sticky function is enabled on the port, the dynamic users learned on the port will exist as static users. If the configuration is saved, the device will still exist after restarting the device.

NOTE:

- Only support L2 port configuration port security, such as ordinary physical port, aggregation port.
- Only support port security configuration in access mode.
- Does not support aggregation port member ports to configure port security functions.
- Does not support SPAN destination port configuration port security function.
- Does not support configuring port security functions on ports that have been configured with static MAC addresses.

4.7.2 Configuring Port Security

Port Configuration

Select Security > Port security in the navigation area to enter the Port security page as shown in Figure 4-43.

4.7.3 Configuration Example

Network requirements:

Limit the number of legal users on interface GigabitEthernet 0/1 to 3, and illegal users whose MACs are 0001.0001.0001, 0001.0001.0002, and 0001.0001.0003 cannot access the device.

Configuration procedure:

(1) Select Security > Port Security from the navigation area, check the box in front of the gigabitEthernet 0/1, click EDIT to enter the page of Port Configuration, as shown in [Figure 4-47](#).

Figure 4-47 Port Security configuration page

Port Configuration

(4) Click Save in the navigation area.

4.8 IP Source Guard

4.8.1 Overview

IP Source Guard:

The Ip Source Guard binding function allows IP packets conforming to the IP+MAC binding to pass through the port, and non-conforming packets are directly discarded, thereby achieving the purpose of preventing IP/MAC spoofing attacks.

The binding entries of Ip Source Guard mainly come from two sources: user static configuration and dynamic acquisition in the ip dhcp snooping environment.

User static configuration: mainly for host users whose IP addresses are statically configured in the local area network.

Ip dhcp snooping dynamic acquisition: mainly respond to the host users who dynamically acquire the IP address through dhcp in the local area network.

IP/MAC spoofing attack: Illegal MAC users send IP packets with legal source IP to realize the legalization of access identity.

ARP Check:

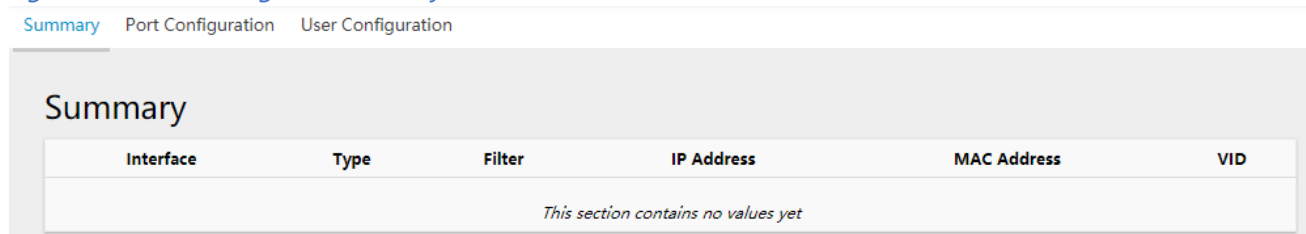

The Arp-check (ARP packet check) function filters all ARP packets under the port and discards all illegal ARP packets, which can effectively prevent ARP spoofing in the network and improve the stability of the network.

In the device that supports the Arp-check function, the Arp-check function can generate corresponding ARP filtering information based on the legal user information (IP+MAC) generated by the security application modules such as IP Source Guard, so as to realize the illegal ARP packets filtering in the network.

4.8.2 Configuring IP Source Guard

(1) Select Security > IP Source Guard in the navigation area to enter the IP Source Guard Summary page as shown in [Figure 4-50](#).

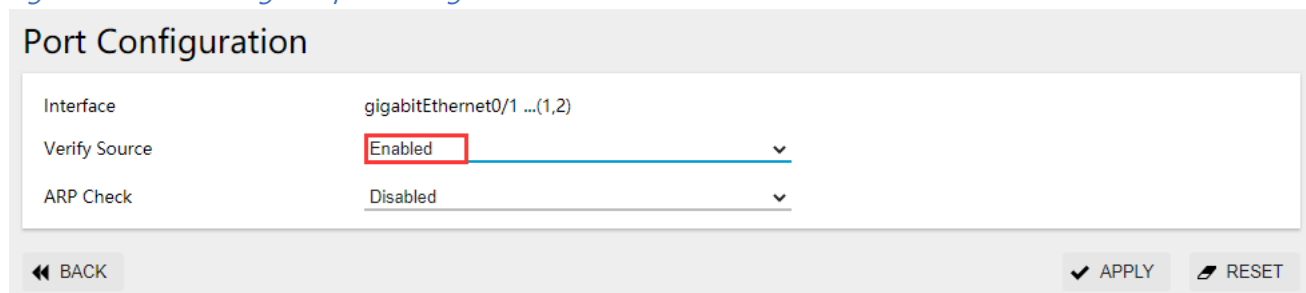

Figure 4-50 IP source guard Summary

Interface	Type	Filter	IP Address	MAC Address	VID
This section contains no values yet					

(2) Click Port Configuration in the current page, check the box in front of the interface to be configured, click EDIT to enter the port configuration page was shown in [Figure 4-51](#), enable Verify Source function.

5.3 Service

5.3.1 Overview

The service management module provides the following types of services: FTP, Telnet, SSH, SFTP, HTTP and HTTPS. You can enable or disable the services as needed. In this way, the performance and security of the system can be enhanced, thus secure management of the device can be achieved.

Telnet Server

The Telnet protocol is an application layer protocol that provides remote login and virtual terminal functions on the network.

SSH Server

Secure Shell (SSH) offers an approach to securely logging in to a remote device. By encryption and strong authentication, it protects devices against attacks such as IP spoofing and plain text password interception

HTTP Server

The Hypertext Transfer Protocol (HTTP) is used for transferring web page information across the Internet. It is an application-layer protocol in the TCP/IP protocol suite. You can log in to the device using the HTTP protocol with HTTP service enabled, accessing and controlling the device with Web-based network management.

HTTPS Server

The Secure HTTP (HTTPS) refers to the HTTP protocol that supports the Security Socket Layer (SSL) protocol. The SSL protocol of HTTPS enhances the security of the device in the following ways:

- Uses the SSL protocol to ensure the legal clients to access the device securely and prohibit the illegal clients;
- Encrypts the data exchanged between the HTTPS client and the device to ensure the data security and integrity, thus realizing the security management of the device;
- Defines certificate attribute-based access control policy for the device to control the access right of the client, in order to further avoid attacks from illegal clients.

5.3.2 Configuring service

(1) Select System > Telnet Server from the navigation area to enter the Telnet Sever configuration page, as shown in [Figure 5-6](#).

(2) Click ENABLED/DISABLED to enable/disable Telnet/SSH service.

(3) When HTTPS Server is enabled, the certificate and private key should be uploaded, as shown in figure. If no certificate is specified, the device will use the default certificate.

Figure 5-6 Server page

Figure 5-7 HTTPS Configuration Page

HTTPS Configuration

Upload Certificate

You can upload the ASN.1 certificate file here, you need to restart the https server for the certificate to take effect.

Certificate:	<input type="button" value="Choose File"/> No file chosen	<input checked="" type="button" value="UPLOAD"/>
Private Key:	<input type="button" value="Choose File"/> No file chosen	<input checked="" type="button" value="UPLOAD"/>

5.4 SNMP

Simple Network Management Protocol (SNMP) offers the communication rules between a management device and the managed devices on the network; it defines a series of messages, methods, and syntaxes to implement the access and management from the management device to the managed devices. SNMP has the following characteristics:

- Automatic network management. SNMP enables network administrators to search and modify information, find and diagnose network problems, plan for network growth, and generate reports on network nodes.
- SNMP shields the physical differences between various devices and thus realizes automatic management of products from different manufacturers. Offering only the basic set of functions, SNMP makes the management tasks independent of both the physical features of the managed devices and the underlying networking technology. Thus, SNMP achieves effective management of devices from different manufacturers, especially in small, high-speed, and low-cost network environments.

SNMP mechanism

An SNMP enabled network comprises Network Management Station (NMS) and agent.

- An NMS is a station that runs the SNMP client software. It offers a user-friendly interface, making it easier for network administrators to perform most network management tasks.
- An agent is a program on the device. It receives and handles requests sent from the NMS. Only under certain circumstances, such as interface state change, will the agent inform the

NMS. NMS manages an SNMP enabled network, whereas agents are the managed network device. NMS and agents exchange management information through the SNMP protocol.

SNMP provides the following four basic operations:

- Get operation: NMS gets the value of a certain variable of the agent through this operation.
- Set operation: NMS can reconfigure the value of one or more objects in the agent MIB (Management Information Base) by means of this operation.
- Trap operation: The agent sends traps to the NMS through this operation.
- Inform operation: The NMS sends traps to other NMSs through this operation.

SNMP Community Configuration

Select System > Service from the navigation area to enter the SNMP Community page, as shown in [Figure 5-7](#). Click +Add... button to add new SNMP Community. [Table 5-4](#) lists the configuration items of the SNMP configuration.

Figure 5-7 SNMP Community page

5.5 Date/Time

The system time module allows you to display and set the device system time on the Web interface. The device supports setting system time through manual configuration and automatic synchronization of NTP server time.

An administrator cannot keep time synchronized among all the devices within a network by changing the system clock on each device, because this is a timeconsuming task and cannot guarantee clock precision.

Defined in RFC 1305, the Network Time Protocol (NTP) synchronizes timekeeping among distributed time servers and clients. NTP allows quick clock synchronization within the entire network and ensures a high clock precision so that the devices can provide diverse applications based on consistent time.

5.5.1 Date and Time interface

Select System > Date and Time from the navigation area. The system time configuration page appears by default, as in [Figure 5-9](#). The current system time and clock status are displayed. [Table 5-6](#) shows the network time configuration items.

Figure 5-9 System time configuration page

Date and Time

5.6 Configuration File Management

5.6.1 Back up configuration

Select System > Configuration File Management from the navigation area to enter the backup configuration page, as shown in [Figure 5-12](#).

Figure 5-12 Configuration File Management page

Configuration File Management

Backup / Restore configuration

Click "Backup configuration" to download the current configuration file.

Download backup:

Click the Backup configuration button, a file download dialog box appears. You can save the file locally.

5.6.2 Restore Configuration

Select Device > Configuration File Management from the navigation area to enter the Restore configuration page, as shown in [Figure 5-13](#).

Figure 5-13 Restore Configuration page

You can upload a previously downloaded backup file here, system will reboot to restore configuration file.

Backup / Restore configuration steps:

1. After you click the Choose File button in this figure, the file upload dialog box appears. You can select the *.conf file to be uploaded, and then click OK.
2. Click the Upload configuration button, then the device will be reboot, as shown in [Figure 5-14](#).

Figure 5-14 Rebooting page

5.6.3 Reset to Factory Defaults

1. Select Device > Configuration File Management > Reset To Factory Defaults from the navigation area to enter the Reset to Factory Defaults page, as shown in [Figure 5-15](#).

Figure 5-15 Reset to Factory Defaults page

2. Click the Reset Configuration button to apply. This operation restores the system to factory defaults, delete the current configuration file, and reboot the device.

5.7 System Upgrade

Software upgrade allows you to obtain a target application file from the current host and set the file as the main boot file or backup boot file to be used at the next reboot.

NOTE:

- A software upgrade takes some time. Do not perform any operation on the web interface during the upgrading procedure; otherwise, the upgrade operation may be interrupted.

1. Select System -> System Upgrade from the navigation area to enter the page as shown in

Figure 5-16.

Figure 5-16 System Upgrade page

System Upgrade

Size: 61009920 Bytes

Uploading: 

5.8 Log/Diagnosis

Each functional module has its own running information, and generally, you need to view the output information for each module one by one. To receive as much information as possible in one operation during daily maintenance or when system failure occurs, the diagnostic information module allows you to save the running statistics of multiple functional modules to a file, and then you can locate problems faster by checking this file.

Figure 5-18 Backup log page

Log/Diagnosis

Backup Log

Click "Backup Log" to download the current logs.

Download backup:

 Backup Log

1. Select Device > Log/Diagnosis from the navigation area to enter the page as shown in [Figure 5-18](#).
2. When you click Backup Log button, the system begins to generate the diagnostic information file, and after the file is generated, the File Download dialog box appears. You can save this file to the local host.

5.9 Reboot

NOTE:

- Before rebooting the device, save the configuration; otherwise, all unsaved configurations are lost after device reboot. After the device reboots, you must re-log in to the Web interface.
-

1. Select System> Reboot from the navigation area to enter the page as shown in [Figure 5-19](#).
2. Click Perform reboot to reboot the device.

6 Diagnosis

6.1 Network Utilities

6.1.1 Overview

Ping

You can use the ping function to check whether a device with a specified address is reachable, and to examine network connectivity. A successful execution of the ping command involves the following steps:

1. The source device sends an ICMP echo request (ECHO-REQUEST) to the destination device.
2. The destination device responds by sending an ICMP echo reply (ECHO-REPLY) to the source device after receiving the ICMP echo request.
3. The source device displays related statistics after receiving the reply. Output of the ping command falls into the following:

- The ping command can be applied to the destination' s host name or IP address. If the destination' s host name is unknown, the prompt information is displayed.
- If the source device does not receive an ICMP echo reply within the timeout time, it displays the prompt information and the statistics during the ping operation. If the source device receives an ICMP echo reply within the timeout time, it displays the number of bytes of the echo reply, the message sequence number, Time to Live (TTL), the response time, and the statistics during the ping operation. Statistics during the ping operation include number of packets sent, number of echo reply messages received, percentage of messages not received, and the minimum, average, and maximum response time.

Traceroute

By using the traceroute command, you can display the Layer 3 devices involved in delivering a packet from source to destination. This function is useful for identification of failed node(s) in the event of network failure.

The traceroute command involves the following steps in its execution:

1. The source device sends a packet with a TTL value of 1 to the destination device.
2. The first hop (the Layer 3 device that first receives the packet) responds by sending a TTL-expired ICMP message to the source, with its IP address encapsulated. In this way, the source device can get the address of the first Layer 3 device.
3. The source device sends a packet with a TTL value of 2 to the destination device.
4. The second hop responds with a TTL-expired ICMP message, which gives the source device the address of the second Layer 3 device.

This process continues until the ultimate destination device is reached. In this way, the source device can trace the addresses of all the Layer 3 devices involved to get to the destination device.

The traceroute command can be applied to the destination' s host name or IP address. If the destination' s host name is unknown, the prompt information is displayed

6.1.2 Diagnostic tool operations

ping operation

1. Select Diagnostic > Network Utilities from the navigation tree to enter the IPv4&IPv6 Ping configuration page.
2. Type in the IPv4 address of the destination device in the text box.
3. Click PING to execute the ping command, and you see the result in the box below.

6.2 Optical Transceiver Information

Optical fiber is commonly used for long distance data transmission. However, when link issues occur, it is very costly to troubleshoot fiber cables and fiber transceivers at remote sites. To solve this problem, Moxa industrial Ethernet switches provide digital diagnostics and monitoring (DDM) functions on SFP optical fiber links and allow users to measure optical parameters and its performance from a central

site. This function can greatly facilitate the troubleshooting process for optical fiber links and reduce costs for onsite debugging.

6.2.1 Displaying Optical Transceiver Information

Select **Diagnosis > Optical Transceiver Information** from the navigation area. The system automatically displays the optical transceiver information, as shown in [Figure 6-5](#). [Table 6-1](#) describes the optical transceiver information items.

Figure 6-4 optical transceiver information

Name	State	Transceiver State	Temperature(degree)	Voltage(V)	Current(mA)	RX Power(dBm)	TX Power(dBm)	Detail
